

Sleep Monitoring

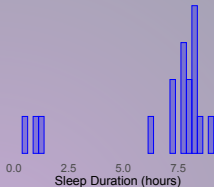

Your sleep was monitored using a Somnify device. The device uses radar technology to detect your movements and breathing patterns during sleep. This was used to record:

- When you fell asleep and woke up
- How long you slept
- Your sleep efficiency (the percentage of time you spent asleep while in bed)

Note: the recording may not be 100% accurate, and can be influenced by external factors such as pets coming into bed.

Number of hours slept per night

Ambient-BD Sleep Report

03/04/2025 to 17/04/2025

Time to fall asleep

Glossary

Chronotype - A person's natural inclination with regard to the timing of sleep and activity periods. Here, we have classified chronotypes into two categories: morning larks (who are more active in the morning) and evening owls (who are more active in the evening). See the [BioClocks UK factsheet](#) for more information on Chronotype.

Sleep duration - The number of hours slept each night, not counting time spent awake in bed.

Sleep efficiency - The percentage of time spent asleep while in bed.

Sleep regularity - A measure of how consistent your sleep and wake times are, on a scale from 0 to 100.

Social Jet-Lag - The difference in sleep timing between weekdays and weekends. A higher value indicates means that you tend to stay up later and wake up later on weekends compared to weekdays.

Somnofy - A device that uses radar technology to monitor sleep patterns, including movements and breathing.

Time to fall asleep - The average time between getting into bed and falling asleep.
